

Polygraph Testing

Jl partners with highly trained and certified polygraph examiners to administer and interpret polygraph examinations, better known as lie detector tests. A polygraph test measures physiological responses to the questions an examiner asks, as indicators of deception. Physiological responses include heart rate/blood pressure, respiration and skin conductivity.

While the validity of polygraph testing has been debated over the years, these tests continue to be a tool for attorneys and law enforcement to use to determine an individual's knowledge of, or participation in a particular crime or to answer other questions deemed relevant as part of a criminal investigation.
